SHAREPOINT HACKATHON 2026

Build Your Own Copilot Cowork with SharePoint

Drop invoices in your usual folder — payment prep runs automatically

PC → SharePoint → Agent → CSV

Best organized library using Knowledge agent **Best use of SharePoint in AI agents**

OUR TEAM

Design Leader

Ryo Sekine
Idea Leader

Speaking notes: Introducing our team and the project — building a Copilot Cowork with SharePoint. Submitting to two hackathon categories.

3 Challenges in Invoice Processing

① Invoices Arrive from Everywhere

Email attachments, downloads, and scans arrive through different channels. Inconsistent file names make it hard to know what is where.

② You Have to Open Every File

To check the payee, amount, or due date, you must open each file. There is no at-a-glance view of status.

③ Everything Is Manual

Even after review, creating bank payment CSVs remains a manual task. There is no automated output.

Core issue: Invoice knowledge is **not organized or connected to the next step** in the process

Speaking notes: Invoice processing gets stuck at three points: file location, content review, and final CSV creation.

Smarter behind the scenes — without changing how you work

Users
Just Drop It

In reality, files sync to SharePoint — the moment they land, the flow starts: organize, check, and prepare for payment. No new steps to learn.

Our goal: Keep user workflows unchanged while SharePoint and AI do the work behind the scenes

BEFORE → AFTER

Before	After
Different handling per intake channel	✅ Just Drop It
Open each file to check contents	✅ SharePoint auto-organizes
Inconsistent file names	✅ Managed via metadata
Manual payment CSV creation	✅ Agent generates the payment CSV

From a **storage location** to an **AI-ready knowledge foundation**

Speaking notes: 、Users。Just Drop It、。

Powered by Three Core Features

AI IN SHAREPOINT

Knowledge Agent(AutoFill)+ Syntex Invoice Data Extraction

- Automatically extract data from invoices
- Invoice Number / Issue Date / Due Date / Amount / Bill To
- Consistency check with AutoFill / Syntex models
- After validation → Trigger Agent ①

INPUT → PROCESS → OUTPUT
Invoice file → Extract & validate → Structured metadata

COPILOT STUDIO

Agent ① Match, Register & Validate

- Match with customer master and register Customer ID
- AI consistency check against billing recipient master
- Human-in-the-loop final review
- Update status to Human Checked

INPUT → PROCESS → OUTPUT
SharePoint + two external masters → Match & validate → Register Customer ID & update status

COPILOT STUDIO

Agent ② CSV Generation

- Filter invoices due this month and marked Human Checked
- Match with bank master to enrich account details
- Group invoices by bank
- Generate bank-specific CSV files

INPUT → PROCESS → OUTPUT
Approved invoices + bank master → Filter & group → Bank-specific CSV

> These three features work together with **SharePoint as the knowledge foundation**, enabling a flow from "just drop it" to "payment ready"

Speaking notes: There are three features: the SharePoint AI layer, Agent ①, and Agent ② — each with a clear role.

Overall Architecture — From "Just Drop It" to "Payment Ready" in 4 Steps

Local PC / Explorer | SharePoint Library | AI in SharePoint (Knowledge Agent) | Copilot Studio Agent | External Master | Output CSV

① Local PC → Auto-sync to SharePoint Document Library

Local PC
Just drop the invoice into Explorer

→ OneDrive

SharePoint
Auto-synced to cloud
Flat storage · Shareable

→

File placed
AI processing starts automatically

↓ When a file is placed, AI in SharePoint starts automatically

② AI in SharePoint（Knowledge Agent）— AutoFill + Syntex

AUTOFILL

Auto-extract invoice data → populate columns

- Invoice Number / Issue Date
- Due Date / Total Amount / Currency
- Bill To Name / Supplier Name

+

SYNTEX

Consistency check on required fields

- Verify all required fields are present
- Detect missing or anomalous values

Syntex complete → Trigger Agent ①

↓ Syntex completion triggers Copilot Studio Agent ①

③ Copilot Studio Agent ① — Customer ID Registration + AI Check + Human in the Loop

SHAREPOINT

- Invoice file body
- AutoFill

+

EXTERNAL MASTER（2）

- Customer Master
- Billing Recipient Master

→

AGENT①

- Bill To NameCustomer Master
- Identify and register Customer ID

→

SP

- Customer ID
- Human Checked

Speaking notes: Walk through this architecture step by step. The user only performs step ① — steps ②③④ are automated.

④ **Approve**
Human

→

⑤ **CSV Output**
Auto

Humans: Drop & Approve only

AI / Agents: Everything else is automated

Human (Drop / Approve) | AI in SharePoint | Agent | Automated Output

Speaking notes: Human work is limited to dropping invoices and approving them. CSV output is generated automatically after approval.

Why this solution fits both categories

CATEGORY 1

Best organized library using Knowledge agent

① **Automatic extraction with AutoFill**

Just drop invoices. AI automatically reads fields and writes them as metadata columns.

② **Flat management with instant view switching**

No folders needed. Switch views to filter by due date, payee, or status.

Key elements: AutoFillSyntex//CustomerID

CATEGORY 2

Best use of SharePoint in AI agents

① **AI-based consistency checks**

Agents validate invoice data and automatically detect errors or missing fields.

② **Match and register with internal data**

Automatically matched with the customer master and Customer ID is written back to SharePoint.

③ **Automated output generation**

Automatically generate bank-specific payment CSVs from approved invoices. No manual work.

Key elements: SharePoint grounding layer2Customer IDCSV

One solution satisfies both categories — because SharePoint functions as an organized knowledge foundation

Speaking notes: This solution is submitted to two categories. Category 1 evaluates the organized library, while Category 2 evaluates agent usage built on SharePoint.

Just drop the file.

SharePoint turns it into knowledge.

Agents act on it.

Payment is ready.

Drop → Organize → Match & Register → Human Approval → CSV Output

Human work is limited to Drop and Approve. Everything else is automated.

Speaking notes: Just drop invoices. SharePoint and agents turn them into knowledge and generate payment-ready outputs.
